

Cabinet: importing products from the National Catalog

This is an informational translation. The matching Russian revision is authoritative. Manager's guide: importing product cards from the Chestny Znak National Catalog, reviewing fields and photos before applying, and managing the product's link to its Chestny Znak card.

Document code	MKR-INS-11

1. Purpose

Importing from the National Catalog is the second way to add a product to the catalog: instead of typing everything, the cabinet takes the data from a Chestny Znak card. This instruction is for a cabinet manager with the right to change operations; filling a card by hand is covered by the separate product-catalog instruction.

- The name, the print name and the product group are carried over from the Chestny Znak card — there is nothing to type.
- The product photo is taken from the Chestny Znak card when it has one and its barcode matches the product GTIN.
- A link remains between the product and its Chestny Znak card: through it the cabinet shows the card status and lets you compare the two.

The import panel opens from the “Add from National Catalog” button in the header of the “Catalog” section and works in three steps: select products, review products, result. The steps are shown at the top of the panel and switch as the data becomes ready.

Note: The screenshots were taken on demonstration data. Product names, GTINs, card identifiers and dates will differ in your cabinet.

Note: The Chestny Znak product-group directory is maintained in Russian and the cabinet shows its names as received, so a group name stays Russian on an English screen — as it does on the review screen below.

2. Before you start

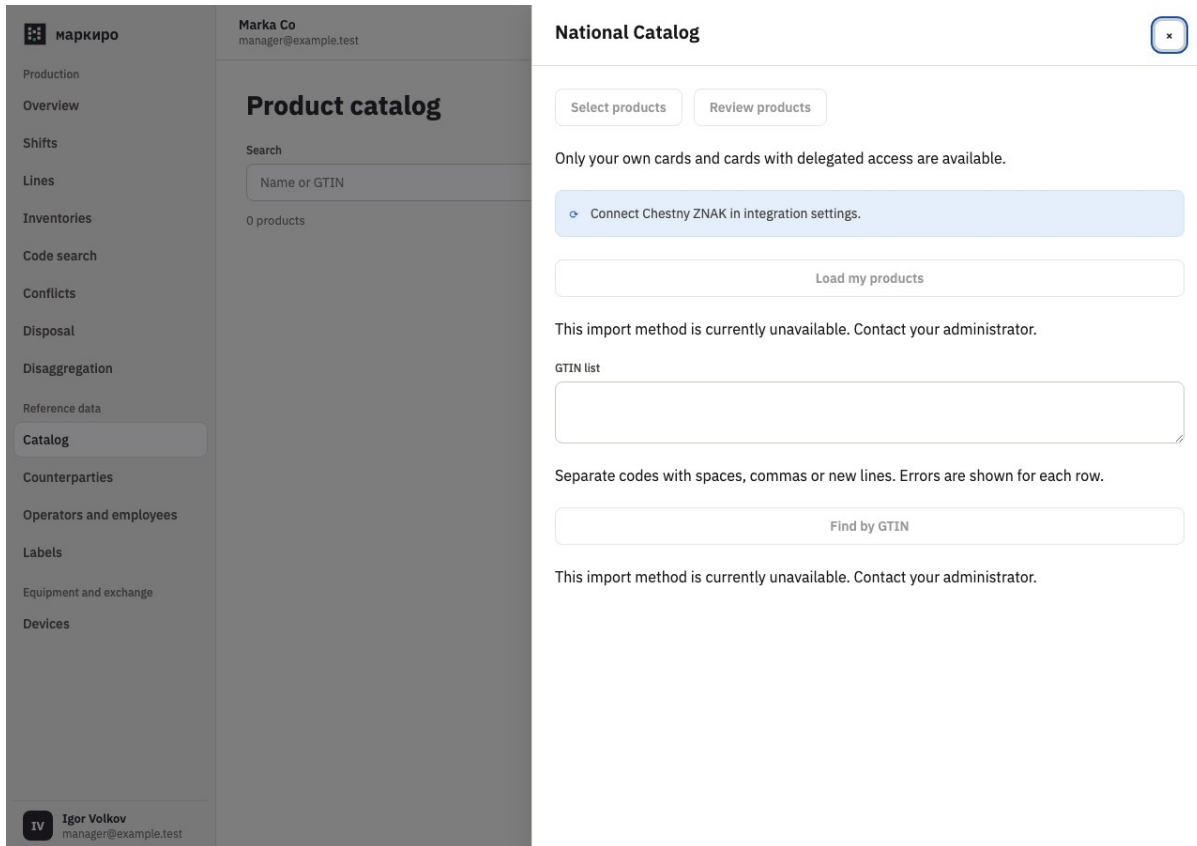

Importing works only when the organization is connected to Chestny Znak and the employee may change operations. An administrator sets the connection up in the integrations section; it cannot be enabled from this panel.

Step 1. Check that the connection is configured

Without a connection the panel still opens, but both import methods are blocked: the hint “Connect Chestny ZNAK in integration settings.” sits at the top and “This import method is currently unavailable. Contact your administrator.” sits under each button. There is nowhere to go from this state — ask your organization's administrator.

The import panel without a Chestny Znak connection

Important: The cabinet does not see the whole National Catalog: “Only your own cards and cards with delegated access are available.” Someone else's card without delegated access will be found neither by list nor by GTIN.

An employee without the right to change operations is shown saved sessions and results, but the buttons that add products stay unavailable.

3. Two ways to import

Step 1. Pick a method

“Load my products” takes the whole catalog the organization can reach in Chestny Znak — convenient when adding products for the first time. The “GTIN list” field is the targeted import: “Separate codes with spaces, commas or new lines. Errors are shown for each row.”, after which you press “Find by GTIN”.

National Catalog

Select products Review products

Only your own cards and cards with delegated access are available.

Load my products

GTIN list

Separate codes with spaces, commas or new lines. Errors are shown for each row.

Find by GTIN

Two ways to import: the whole catalog or a GTIN list

Expected result: The panel moved to the “Select products” step and began filling the list.

The two methods are enabled independently: what is available depends on the connection and its settings, so one of them may work while the other does not. A blocked method always carries an explanation under its button.

4. Selecting products

Step 1. Wait for the list to load

Above the list the cabinet prints how many rows are loaded and when loading started. The list fills up gradually: products already loaded can be selected without waiting for the end. The “Search loaded products” field and the “Card status” list narrow the selection, and “Previous page” and “Next page” page through it.

The screenshot shows the 'National Catalog' interface. On the left is a sidebar with a menu. The main area is titled 'Product catalog' and contains a search bar. Below the search bar, it says '0 products'. On the right, there's a 'Select products' section with a table. The table has two columns: 'PRODUCT' and 'MATCH'. There is one row in the table with the product '04006381333931 - Milk' and a match status of 'New product'. Above the table, there's a 'Selected: 0 of 100' indicator and a checkbox to 'Select all on this page (1)'. At the bottom of the table, there are buttons for 'Previous page', 'Next page', and 'Review selected products'.

The “Select products” step: a loaded card and its match

The “Match” column shows what the cabinet already knows about each card. What happens when the import is applied depends on that value.

New product — No product with this GTIN exists in the catalog — a new card will be created.

GTIN exists: review fields and add a link — The product is in the catalog but not linked to a Chestny Znak card. The cabinet will offer to add the link and, if needed, update the fields.

Already linked — The product and the card are linked; there is no link left to add.

Linked to another card — The product is linked to a different Chestny Znak card. Replacing it has to be confirmed during the review step.

Archived local product — The product was retired with the “Do not use” checkbox in its catalog card.

Multiple matches: review selection — More than one catalog product carries this GTIN — pick one by hand.

No card access — The card exists, but the organization was not granted access to it in the National Catalog.

Step 2. Tick the products and move to the review

The counter “Selected: 0 of 100” shows the limit of one operation — no more than a hundred positions at a time. The “Select all on this page (1)” checkbox ticks the whole visible page. When the selection is ready, press “Review selected products”.

Expected result: The panel moved to the “Review products” step and prepared the data for every position.

5. Reviewing before applying

The review step is the only place that shows exactly what will change. The hint at the top states the rule: “Review each product’s link, fields and photo. Only selected fields will change.”

Step 1. Compare the current and the proposed value

Positions are laid out in tabs: the counter “Product 1 of 1” and the “Previous product” and “Next product” buttons switch between them. Fields are shown in pairs: “Currently in Markiro” on the left and “Proposed value”, marked “From Chestny ZNAK”, on the right. A tick on a value card means it will be applied; “Do not add” on the left means the catalog field is still empty. The “Show only mapped fields” checkbox hides everything that cannot be carried over.

The screenshot displays the Markiro National Catalog interface. On the left is a sidebar with navigation links: Production, Overview, Shifts, Lines, Inventories, Code search, Conflicts, Disposal, Disaggregation, Reference data, Catalog (selected), Counterparties, Operators and employees, Labels, Equipment and exchange, and Devices. The main header shows 'Marka Co' and 'manager@example.test'. The 'Product catalog' section has a search bar and shows '0 products'. The 'Review products' panel is active, showing 'Product 1 of 1'. It includes a 'Show only mapped fields' checkbox and a list of fields to be reviewed. Each field is presented in a pair: 'Currently in Markiro' and 'Proposed value'. The 'Proposed value' column includes a checkmark indicating the value is selected. The fields shown are Name, Print name, Product group, and Photo. At the bottom, a summary bar shows 'Create products: 1 · Add links: 1 · Replace links: 0 · Change products: 0 · Upload photos: 1' and buttons for 'Refresh review' and 'Apply selected'.

Currently in Markiro	Proposed value
Name Currently in Markiro Milk 3.2%	Name ✓ From Chestny ZNAK Pasteurised drinking milk 3.2%
Print name Currently in Markiro Do not add	Print name ✓ From Chestny ZNAK Milk 3.2%
Product group Currently in Markiro Do not add	Product group ✓ From Chestny ZNAK Молочная продукция
Photo Currently in Markiro No photo	Photo ✓ From Chestny ZNAK Choose this photo

Create products: 1 · Add links: 1 · Replace links: 0 · Change products: 0 · Upload photos: 1

Reviewing a product: three fields and a photo from the Chestny Znak card

Step 2. Set the name by hand when the card has none

The “Manual name” field overrides the name from the card: “Up to 200 characters. Leave blank to use the card name; enter a name if the card has none.” For a product already in the catalog a checkbox appears that adds only the link without touching the fields, and for a product linked to another card there is a separate confirmation of the replacement.

Step 3. Check the totals and apply

The panel counts the totals at the bottom: “Create products: 1 · Add links: 1 · Replace links: 0 · Change products: 0 · Upload photos: 1”. “Refresh review” re-reads the data from Chestny Znak and “Apply selected” starts adding.

Expected result: The panel moved to the “Result” step.

Step 4. Deal with a position that cannot be applied

When a position cannot be applied, its tab is marked “Unavailable” and the reason is printed both above the form and next to the offending field. In the frame below it is “The ChZ categories indicate multiple or conflicting groups. Select the group in the product form.”: the group on the right reads “Not set”, “Apply selected” is disabled, and the bottom line says “Complete your choices and update the review to see the totals.”

The screenshot displays the Markiro National Catalog interface. On the left is a sidebar with navigation links: Production, Overview, Shifts, Lines, Inventories, Code search, Conflicts, Disposal, Disaggregation, Reference data, Catalog (highlighted), Counterparties, Operators and employees, Labels, Equipment and exchange, and Devices. The main header shows 'Marka Co' and 'manager@example.test'. The 'Product catalog' section has a search bar and shows '0 products'. The 'Review products' section is active, showing 'Product 1 of 1' and buttons for 'Previous product' and 'Next product'. The product being reviewed is '1. Milk · 04006381333931 · Un... Unavailable'. A checkbox 'Show only mapped fields' is present. The product details form shows 'New product' with an error message: 'The ChZ categories indicate multiple or conflicting groups. Select the group in the product form.' The form fields are divided into 'Currently in Markiro' and 'Proposed value' columns. The 'Proposed value' column has a checkmark next to each field. The 'Product group' field in the 'Proposed value' column has a dropdown menu with 'From Chestny ZNAK' selected and 'Not set' as an option. The 'Photo' field in the 'Proposed value' column has a checkmark and a button 'Choose this photo'. At the bottom, there is a message 'Complete your choices and update the review to see the totals.' and buttons for 'Refresh review' and 'Apply selected'.

A position with an ambiguous product group: applying is blocked

Important: Prepared data lives for a limited time. If a long while passes between the review and applying it, the cabinet asks you to refresh the review — a guard against applying a stale comparison.

6. Photo

Step 1. Pick a photo from the Chestny Znak card

The “Photo” block is built like the other fields: what the product has now on the left, the picture “From Chestny ZNAK” with the “Choose this photo” button on the right. When the product has no photo yet, the left side reads “No photo”.

Photo

Photo Currently in Markiro No photo	Photo ✓ From Chestny ZNAK  Choose this photo
---	--

The “Photo” block: the Chestny Znak picture is selected

Expected result: The picture is ticked and joins the totals as an upload.

The picture does not reach the card instantly: the cabinet prepares it first. While that runs the candidate reads “Preparing photo”, and a failed preparation is marked “Photo not loaded”.

The photo GTIN differs from this product — The picture belongs to another code. Select it only after checking — otherwise the wrong product ends up on the label.

This photo has an invalid GTIN — The code on the picture fails validation, so the cabinet does not offer it.

New photos cannot be prepared right now — Keep the product's current photo or add the product without one; the other fields are unaffected.

7. Result

Step 1. Read the outcome for each position

The state of the whole operation is printed at the top of the step — for example “Processing completed”. For every position the outcome is given separately for the product and for the photo: “Product: Added”, “Photo: Failed”. A failure comes with an explanation and a retry button: “Photo download failed. The product can be added separately.”, “Product added. Photo failed to load.”, “Retry photo upload”.

The screenshot displays the MARKIRO National Catalog interface. On the left is a sidebar with a menu including Production, Overview, Shifts, Lines, Inventories, Code search, Conflicts, Disposal, Disaggregation, Reference data, Catalog (highlighted), Counterparties, Operators and employees, Labels, Equipment and exchange, and Devices. The main area is titled 'Product catalog' and includes a search bar with the placeholder 'Name or GTIN' and a message '0 products'. On the right, the 'National Catalog' header is visible with a close button. Below it are three buttons: 'Select products', 'Review products', and 'Result'. The 'Result' section shows 'Processing completed' and a 'Product: Added' status. An 'Open catalog product' button is present. Below this, a 'Photo: Failed' message is shown with the text 'Photo download failed. The product can be added separately.' A blue notification bar contains the message 'Product added. Photo failed to load.' and a 'Retry photo upload' button.

The result: the product was added, the photo failed

Added — The product was created or updated and the link was saved.

Data conflict — The data changed between the review and applying it. Refresh the review and try again.

Failed — The position was not added; its retry button sits beside it.

Stopped — Adding the remaining positions was interrupted with the stop button; what was already added is kept.

Step 2. Wait for the photo to be saved

While the operation runs the state reads “Adding products” and the photo is queued: “Photo: Pending”. “Open catalog product” stays disabled meanwhile, with the reason beside it: “Saving the photo. You can open the product when it is ready.” The “Stop adding remaining products” button ends the processing of the positions still queued.

The screenshot shows the Markiro application interface. On the left is a sidebar with a navigation menu. The main content area is titled 'Product catalog' and includes a search bar. On the right, a 'National Catalog' modal is open, displaying a 'Result' section. This section indicates that a product has been added and shows the current state of saving the product photo. A button to 'Open catalog product' is visible, along with a message about saving the photo and a 'Photo: Pending' status. A button to 'Stop adding remaining products' is also present.

The product was added, the photo is still saving

Expected result: Once the photo is saved, “Open catalog product” becomes available.

Note: The result of an operation is kept: the panel can be closed and revisited later, and retrying failed positions does not duplicate the products that were already added.

8. The Chestny Znak link

Once a product is added it carries a link to its Chestny Znak card. A dedicated catalog column stands for it: the column shows the state of the card in Chestny Znak, and its link opens the “Chestny ZNAK link” panel.

Step 1. Read the link details

The panel shows the card status — “Published”, for instance — and the saved details: “Card”, “Environment” (“Production” or the sandbox), “Linked GTIN” and “Link confirmed”. The “Details” toggle reveals the “Last successful check” and “Last attempt” timestamps.

The screenshot displays the MARKIRO application interface. On the left is a sidebar menu with various navigation options. The main area is split into two panels. The left panel, titled 'Product catalog', shows a search bar and a table with one product entry: 'Milk' with GTIN '04006381333931'. The right panel, titled 'Chestny ZNAK link', shows the status 'Published' and details for the linked card, including the GTIN and a confirmation timestamp. At the bottom of this panel are buttons for 'Refresh status', 'Compare card', 'Remove link', and a 'Reload details' button.

The link panel of a product and its Chestny Znak card

- “Refresh status” re-reads the state of the card in Chestny Znak.
- “Compare card” opens the same field review as the import does, for a card that is already linked.
- “Remove link” removes only the link: the product, the accepted values, the photo and the history stay in the catalog.
- “Reload details” re-requests the panel itself when the data did not appear.

Step 2. Read what a failed check means

A failed check does not erase the saved details: the cabinet marks it with the line “The latest check failed. Saved information is shown.” and hides the reason behind “Details” — in the frame below it is “The linked card is unavailable in CHZ.” The card status stays as it was, from the moment of the last successful check.

The screenshot displays the Markiro application interface. On the left is a sidebar menu with various navigation options. The main area is divided into two panels. The left panel, titled 'Product catalog', shows a search bar and a table with one product entry: 'Milk' with GTIN '04006381333931'. The right panel, titled 'Chestny ZNAK link', shows the details of the 'Milk' product card. It includes a status bar indicating 'Published', a message about a failed check, and a table of details. The details table shows the card name 'card-1', environment 'Production', and a confirmed link date of '9/8/2026, 3:00:00 AM'. At the bottom of the details panel are buttons for 'Refresh status', 'Compare card', 'Remove link', and 'Reload details'.

9. Common problems

The cabinet could not identify the product group — The categories of the Chestny Znak card do not give an unambiguous group, or the group is not in the Markiro reference list yet. The product can still be added and the group picked by hand in the product card.

The product is already linked to another card — Replacing a link needs an explicit confirmation during the review. Before confirming, make sure the new card describes the same product.

The review data has expired — Too much time passed between preparing the review and applying it. Press “Refresh review” and check the values again.

The photo failed to load — The product itself was added. Retry the upload from the result step, or add a picture by hand in the product card.

Loading the list was interrupted — Products already loaded stay available for selection; continue loading the list or start it again.

The previous request has no confirmed response — The cabinet keeps the unfinished request and offers to recover its result. Do that before adding anything new — otherwise an operation that was already accepted may be repeated.

If your problem is not described above, contact your organization's administrator or Markiro support: hello@v-b.tech.
